### **Assessment: ALL OUTCOMES**

### Introduction

#### Please read the following documentation carefully.

This assessment can be completed **IN** and **OUT** of class. This is **open book** – you may reference any notes or resources and use past exercises and examples.

There are several separate stages of this project, please ensure that you manage your time effectively to meet the overall deadline.

Your assessor is required to check the authenticity of any unsupervised work.

Please read all the evidence requirements for each stage and clarify any points with your assessor.

The assessment is divided into the following sections:

- Section 1 Assessment Brief:
  - This section contains the UML design documents and Use Case diagrams.
- Section 2 Implementation
  - Contains instructions and a checklist of assessment criteria for you to use while you implement the project.
- Section 3 Testing
  - Contains instructions and a checklist of criteria for you to use while you test the project.
- Remediation and Reassessment
  - One remediation attempt will be permitted on areas that do not meet the criteria.
  - If after remediation the work still does not meet criteria, a 2nd attempt on a new brief will be required

### **Section 1: Assessment Brief**

### Please read the following design brief carefully:

As a software developer, you have been approached to develop a computer program to manage library stock. This system is developed separately from the library loans system, which is a separate system outside of the scope of this brief.

Each library offers a selection of books, journals and audio/video material on offer to the public. This system is managed by library staff, who input this information centrally.

All **borrowable items** have a unique id (integer), a type (text), title (text), a location (text) and a cost (float) and whether or not the item has been issued (boolean)

#### In addition:

- Books have an author (text), a publisher (text), and a number of pages (integer)
- **Journals** have a publisher (text), issue number (integer), subject area (text), and number of pages (integer)
- Audio/Video items have a duration (int minutes), and format (text CD/DVD)

The program must be menu driven – you add sub-menus to help organise information. Users should have the ability to view the entire list of library items or view specific types of item only – e.g. displaying only Books or only Journals.

Users should have the ability to add, delete and search for each different type of item and display them on screen.

The program must have an option to add up the total cost of all items in the inventory and display this on screen.

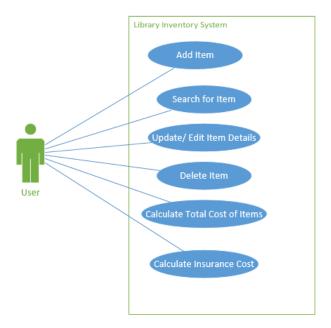

Your program should have appropriate input validation and provide error messages to guide the user if they make mistakes.

In addition, your program should provide an insurance cost. The insurance cost is 50% of the total cost of the items. The cost of insurance should be displayed on the same screen as the total cost. No matter how much the cost works out to be, the final cost of insurance will be capped at £400.

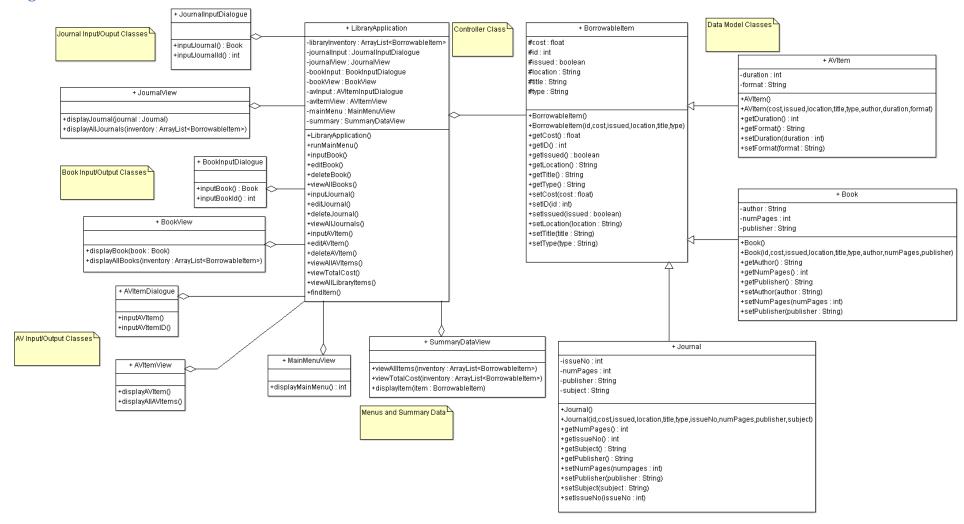

You should follow the design shown overleaf – although you do not need to stick with this rigidly.

# **Design Diagrams**

**Use Case Diagram** 

### **Class Diagram**

# **Section 2: Implementation**

# **Learning Outcomes 1 and 2**

You are required to create an object-oriented program for the brief provided in Section 1.

The design brief should be the **basis** of your solution. You may add additional features if you wish.

Your solution must demonstrate each of the criteria in the assessment checklist.

# **Section 3: Testing**

# **Learning Outcome 3**

You are now required to develop a test plan and test the completed program. You should produce appropriate test logs to identify any areas where the program fails and detail any fixes and retests required.

Your testing must demonstrate each of the criteria in the assessment checklist.

Class Sassement Requirement Satisfactory (S)/ Unsatisfactory (U) Comments  Outcome 1  Abstraction, Encapsulation and information hiding used where appropriate.  Inheritance used if appropriate to the solution.  Polymorphism used only if appropriate to the rore to the solution.  Class-wide variables are private to prevent content coupling.  Class-wide variables are kept to a minimum of common coupling.  Data coupling is used (using parameter passing) in preference to content or common coupling.  Program does not contain a lot of unnecessary data coupling.  Classes are highly cohesive.  Outcome 2  Implement a working solution which meets the requirements of the given brief.  Declare and initialise variables.  Correctly use arithmetic and/ or logical operators.  Implement a range of control structures.  Access and manipulate a data structure.	Candidate name		Candidate ID		
Outcome 1  Abstraction, Encapsulation and information hiding used where appropriate.  Inheritance used if appropriate to the solution.  Polymorphism used only if appropriate to to prevent content coupling.  Class-wide variables are private to prevent content coupling.  Class-wide variables are kept to a minimum to ensure a minimum of common coupling.  Data coupling is used (using parameter passing) in preference to content or common coupling.  Program does not contain a lot of unnecessary data coupling.  Classes are highly cohesive.  Outcome 2  Implement a working solution which meets the requirements of the given brief. methods, and a constructor	•				
method.					
Create a minimum of three					
objects from the classes, with					
appropriate initial attribute	-				

Software Development: Object Oriented Programming values set through the Constructor methods. Satisfactory (S)/ **Assessment Requirement Comments** Unsatisfactory (U) Implement at least one overloaded method (this may be the constructor). Link the classes appropriately through association, aggregation, or inheritance relationships. Pass parameters correctly both within and between objects. Define the access type (public, private, or protected) for methods, attributes and classes, and the access modifiers chosen are appropriate. Make use of pre-defined Classes and/ or Methods from the standard object library. Appropriately handle errors with exceptions or pre-validation. Implement code commented appropriately throughout. **Outcome 3** Implement a test plan using a defined strategy. Maintain test documentation. Evaluate the results of test runs. Amend code as necessary. The comment column can be used to highlight any re-assessment that may be needed. **Overall comments** Assessor's signature **Date**
